

Input data for the 2013 rock lobster assessments of the Tristan da Cunha group of islands

Susan Johnston and Doug Butterworth

MARAM

Department of Mathematics and Applied Mathematics

University of Cape Town

Rondebosch, 7701

The following data are used as model inputs to the 2013 updated assessments (Johnston and Butterworth 2013) of the Tristan da Cunha rock lobsters. Note the convention that, for example, the 2007 season refers to the period Sept 2007 to Aug 2008.

Catch

Table 1 reports the total commercial catches for each island. Note these values exclude the small amounts taken for the biomass surveys. Data provided by James Glass (pers. commn).

CPUE

Standardised longline CPUE data for Inaccessible, Nightingale and Gough, and standardised powerboat data for Tristan are reported in Table 2a. Johnston *et al.* (2013) provide further details of these data.

Nominal powerboat CPUE data for the three outer islands are reported in Table 2b. These data are not used in fitting the model, but are used for comparative purposes only.

Biomass survey index

A biomass survey index is calculated for each island, for both Leg1 and Leg2 for seasons 2006-2012. Note that Leg2 2006 thus refers to the biomass survey done in February 2007. These values represent the full size range of lobsters found in the survey traps. Further detail can be found in Johnston (2013). The mean index values and the associated CVs are reported in Table 2c.

Catch-at-Length data

Commercial catch samples

The catch-at-length data are obtained from the onboard observers who sample the catch onboard before the undersized lobsters are returned to the sea. Males and females are recorded separately. These data are reported in Tables 3-6 and cover seasons 1997-2011.

Biomass surveys

These data are discussed in detail in Johnston (2013). Data are collected for two surveys each season – Leg1 (around September) and Leg2 (around Feb). Males and females are recorded separately. These data are reported in Tables 7-10 and cover seasons 2006-2012.

Discard % data

The longline catch and effort database for Inaccessible, Nightingale and Gough is used to calculate the percentage (by weight) of the discarded lobsters relative to the total catch hauled. These data are reported in Table 11.
